# The Loewner equation with complex-valued driving functions

Joan Lind – University of Tennessee joint work with Jeffrey Utley

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Outline

Introduction to the Loewner equation

- Loewner hulls with complex-valued driving functions
- Phase transition for complex-driven Loewner hulls
- Differences between complex-driven Loewner hulls and real-driven Loewner hulls

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Brief history

Bieberbach conjecture (1916): For  $f(z) = z + a_2 z^2 + a_3 z^3 + \cdots$  conformal on  $\mathbb{D}$ , then  $|a_n| \leq n$ .

Charles Loewner introduced the Loewner equation in 1923 to prove the n = 3 case.

Louis des Branges again used the Loewner equation when he proved the conjecture in 1985.

In 2000, Oded Schramm introduced Schramm-Loewner Evolution,  ${\sf SLE}_\kappa.$ 

### The chordal Loewner equation

growing families of 2-d sets

real-valued functions

A D > A P > A B > A B >

э

#### From functions to growing families of sets

For a continuous, real-valued function  $\lambda(t)$  and  $z \in \mathbb{H}$ , consider

$$rac{\partial}{\partial t}g_t(z) = rac{2}{g_t(z) - \lambda(t)}, \quad g_0(z) = z$$

#### From functions to growing families of sets

For a continuous, real-valued function  $\lambda(t)$  and  $z \in \mathbb{H}$ , consider

$$rac{\partial}{\partial t}g_t(z) = rac{2}{g_t(z) - \lambda(t)}, \quad g_0(z) = z$$

Loewner hulls:  $K_t = \{z \in \mathbb{H} : g_s(z) = \lambda(s) \text{ for some } s \leq t\}.$ 

#### From functions to growing families of sets

For a continuous, real-valued function  $\lambda(t)$  and  $z \in \mathbb{H}$ , consider

$$\frac{\partial}{\partial t}g_t(z) = \frac{2}{g_t(z) - \lambda(t)}, \quad g_0(z) = z$$

Loewner hulls:  $K_t = \{z \in \mathbb{H} : g_s(z) = \lambda(s) \text{ for some } s \leq t\}.$ 

Theorem:  $g_t$  is a conformal map from  $\mathbb{H} \setminus K_t$  onto  $\mathbb{H}$ .

# Loewner equation visual

$$\frac{\partial}{\partial t}g_t(z) = \frac{2}{g_t(z) - \lambda(t)}$$

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = のへで

Loewner flow

$$\frac{\partial}{\partial t}g_t(z) = 2 \frac{\operatorname{Re} g_t(z) - \lambda(t)}{|g_t(z) - \lambda(t)|^2} - 2i \frac{\operatorname{Im} g_t(z)}{|g_t(z) - \lambda(t)|^2}$$

# Example 1

Loewner hull generated by  $\lambda(t) \equiv 0$ .

Question: When are the Loewner hulls a simple curve?

Question: When are the Loewner hulls a simple curve?

Lip(1/2) functions:

$$|\lambda(t) - \lambda(s)| \leq M |t-s|^{1/2}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

for all t, s is the domain of  $\lambda$ . The smallest such M is  $||\lambda||_{1/2}$ .

Question: When are the Loewner hulls a simple curve?

Lip(1/2) functions:

$$|\lambda(t) - \lambda(s)| \leq M |t-s|^{1/2}$$

for all t, s is the domain of  $\lambda$ . The smallest such M is  $||\lambda||_{1/2}$ .

Answer: (Marshall, Rohde) There exists  $C_0 > 0$  so that for  $\lambda \in \text{Lip}(1/2)$  with  $||\lambda||_{1/2} < C_0$ , then the Loewner hull is a quasislit  $\gamma$ .

Question: Do all Lip(1/2) driving functions generate simple curves?

Question: Do all Lip(1/2) driving functions generate simple curves?

Answer: (Marshall, Rohde) No. There is a non-simple example (a curve that spirals around a disc) that is generated by a Lip(1/2) driving function.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Question: What is the optimal value of  $C_0$  for the Marshall-Rohde theorem?

Question: What is the optimal value of  $C_0$  for the Marshall-Rohde theorem?

(ロ)、(型)、(E)、(E)、 E) の(()

Answer: (L)  $C_0 = 4$ .

Question: What is the optimal value of  $C_0$  for the Marshall-Rohde theorem?

Answer: (L) 
$$C_0 = 4$$
.

Key examples: 
$$\lambda(t) = -c\sqrt{1-t}$$

Fix complex-valued  $\lambda$  with small Lip(1/2) norm.

Consider the family of driving functions  $\alpha\lambda$  for  $\alpha\in\mathbb{D}$ .

Question: What can we say about the Loewner hulls driven by  $\alpha\lambda$ ?

Answer (Tran) There exists  $\gamma: \mathbb{D} \times [0,1] \to \mathbb{C}$  so that

- For fixed  $t \in [0, 1]$ , the map  $\alpha \mapsto \gamma(\alpha, t)$  is holomorphic.
- For fixed  $\alpha \in \mathbb{D}$ , the map  $t \mapsto \gamma(\alpha, t)$  is injective.

$$\triangleright \ \gamma(0,t)=2i\sqrt{t}.$$

For α ∈ D ∩ ℝ, then γ<sup>α</sup> = γ(α, ·) is generated by αλ from the Loewner equation.

Answer: (Tran) There exists  $\gamma:\mathbb{D} imes [0,1] o\mathbb{C}$  so that

- For fixed  $t \in [0, 1]$ , the map  $\alpha \mapsto \gamma(\alpha, t)$  is holomorphic.
- For fixed  $\alpha \in \mathbb{D}$ , the map  $t \mapsto \gamma(\alpha, t)$  is injective.
- $\triangleright \ \gamma(0,t)=2i\sqrt{t}.$
- For  $\alpha \in \mathbb{D} \cap \mathbb{R}$ , then  $\gamma^{\alpha} = \gamma(\alpha, \cdot)$  is generated by  $\alpha \lambda$  from the Loewner equation.

This implies that  $F(\alpha, w) := \gamma(\alpha, -w^2/4)$  is a holomorphic motion of [0, 2i].

Answer: (Tran) There exists  $\gamma:\mathbb{D} imes [0,1] o\mathbb{C}$  so that

- For fixed  $t \in [0, 1]$ , the map  $\alpha \mapsto \gamma(\alpha, t)$  is holomorphic.

This implies that  $F(\alpha, w) := \gamma(\alpha, -w^2/4)$  is a holomorphic motion of [0, 2i].

Hence  $\gamma^{\alpha}(t) = \gamma(\alpha, t)$  is a quasiarc.

Answer: (Tran) There exists  $\gamma: \mathbb{D} \times [0,1] \to \mathbb{C}$  so that

- For fixed  $t \in [0, 1]$ , the map  $\alpha \mapsto \gamma(\alpha, t)$  is holomorphic.
- For fixed  $\alpha \in \mathbb{D}$ , the map  $t \mapsto \gamma(\alpha, t)$  is injective.
- $\triangleright \ \gamma(0,t)=2i\sqrt{t}.$
- For  $\alpha \in \mathbb{D} \cap \mathbb{R}$ , then  $\gamma^{\alpha} = \gamma(\alpha, \cdot)$  is generated by  $\alpha \lambda$  from the Loewner equation.

This implies that  $F(\alpha, w) := \gamma(\alpha, -w^2/4)$  is a holomorphic motion of [0, 2i].

Hence  $\gamma^{\alpha}(t) = \gamma(\alpha, t)$  is a quasiarc.

Think of  $\gamma^{\alpha}$  as the "top curve" generated by  $\alpha\lambda$  from the Loewner equation.
