

Unique Factorization of Feynman Graphs

D. Kreimer

- (pre-) Lie algebras of graphs
- Hopf algebras
- Renormalization
- "prime graphs"
- factorization of D-S eq.
- gauge theories

collab. with D.J. Broadhurst, A. Coon

We can count.

1, 2, 3, 2·2, 5, 2·3, 7, 2·2·2, 3·3, 2·5, 11, ..

perturbative expansion

"prime decomposition" ??

What about the "primes" itself?

To what extent do they determine the general graph?

How unique is the decomposition of a problem into subproblems?

How can I efficiently reassemble the total from its parts?

set-up

- Lie algebra of insertions of graphs
- Hopf algebra of decomposition
- decompose problem until its simple
- evaluate $\hat{=}$ Feynman rules
- prop. structure of characters on \mathcal{H}
- compare!

- choose renormalization scheme

$$\tilde{\Sigma}_R^\phi * \phi$$

$$\tilde{\Phi}^{-1} * \phi$$

$$\tilde{\Phi} = \Sigma_R^\phi \circ S$$

The Lie algebra of Feynman graphs

$$\Gamma_1 = \text{triangle} \quad \Gamma_2 = \text{bubble} \quad \Gamma_3 = \text{loop} \quad [\text{QED, say}]$$

$$[\Gamma_1, \Gamma_2] = \text{"2 into 1 - 1 into 2"}$$

$$[\text{triangle}, \text{bubble}] = \text{triangle with bubble} + \text{triangle with bubble} - 2 \text{ bubble}$$

$$[[\text{triangle}, \text{bubble}], \text{loop}] + [[\text{loop}, \text{triangle}], \text{bubble}]$$

$$+ [[\text{bubble}, \text{loop}], \text{triangle}] = 0$$

Jacobi : $\sum_{\text{cyclic}} [[\Gamma_i, \Gamma_j], \Gamma_k] = 0$

Where does this come from?

$$\Gamma_1 * \Gamma_2 = \text{"2 into 1"}$$

$$(\Gamma_1 * \Gamma_2) * \Gamma_3 - \Gamma_1 * (\Gamma_2 * \Gamma_3)$$

$$= \Gamma_1 * \{ \Gamma_2 \cup \Gamma_3 \}$$

$$= (\Gamma_1 * \Gamma_3) * \Gamma_2 - \Gamma_1 * (\Gamma_3 * \Gamma_2)$$

O.k., we can insert pringles,

so what?

We can also decompose them!

→ the art of decomposition

product: $a \times b \rightarrow a \cdot b$

coproduct: $X \rightarrow X' \otimes X''$

$A \times A \rightarrow A$

" $\Delta[H] = H \otimes H$ "

$$\Delta \left[m \left(\begin{array}{c} \text{circle} \\ \text{with} \\ \text{diagonal} \end{array} \right) \right] = m \left(\begin{array}{c} \text{circle} \\ \text{with} \\ \text{diagonal} \end{array} \right) \otimes 1 + 1 \otimes m \left(\begin{array}{c} \text{circle} \\ \text{with} \\ \text{diagonal} \end{array} \right) + 2 \left(\begin{array}{c} \text{triangle} \\ \text{with} \\ \text{diagonal} \end{array} \right) \otimes m \left(\begin{array}{c} \text{circle} \\ \text{with} \\ \text{diagonal} \end{array} \right)$$

$$m[\tau_i, \tau_j] = \tau_i \tau_j$$

$$\Delta[\Gamma] = \Gamma \otimes 1 + 1 \otimes \Gamma + \sum_{\delta \subset \Gamma} \delta \otimes \Gamma/\delta$$

$$1^*(\Gamma) = 0 \quad 1^*(1) = 1.$$

... and the is a coincidence as

well

$$S(\emptyset) = e$$

$$S[\Gamma] = -\Gamma - \sum_{\gamma \in \Gamma} S(\gamma) \Gamma/\gamma$$

$$\begin{aligned} S[\text{circle with crack}] &= -\text{circle with crack} - 2 S[\text{triangle}] \text{circle with crack} \\ &= -\text{circle with crack} + 2 \text{triangle} \text{circle with crack} \end{aligned}$$

→ bring in Feynman rules

$$\phi[\Gamma] = \text{"y"}$$

$$\phi: H \rightarrow V$$

$$\phi(\Gamma_1, \Gamma_2) = \phi(\Gamma_1) \phi(\Gamma_2)$$

We have a problem 😊!

And can solve it!

Let $R: V \rightarrow V$ be a Baxter map.

$$R[ab] + R[a]R[b] = R[R[a]b] + R[aR[b]].$$

$$S_R^\phi: H \rightarrow V$$

$$S_R^\phi(\Gamma) = -R\left[\phi(\Gamma) + \sum_{\gamma \subset \Gamma} S_R^\phi(\gamma) \phi(\Gamma/\gamma)\right]$$

↑ twisted by R.

$$\phi \circ S(\Gamma) = -\left[\phi(\Gamma) + \sum_{\gamma \subset \Gamma} \phi \circ S(\gamma) \phi(\Gamma/\gamma)\right]$$

$$\psi: H \rightarrow V \quad \phi: H \rightarrow V$$

$$\psi * \phi: H \rightarrow V$$

$$\psi * \phi(\Gamma) = m_V \circ (\psi \otimes \phi) \circ \Delta[\Gamma].$$

$$S_R^\phi * \phi(u \circlearrowleft \gamma) = \phi(u \circlearrowleft \gamma) + S_R^\phi(u \circlearrowleft \gamma) + 2 S_R^\phi(u \circlearrowleft \gamma) \phi(u \circlearrowright \gamma).$$

$$S_R^\phi(u \circlearrowleft \gamma) = -R[\phi(u \circlearrowleft \gamma)] - 2R[S_R^\phi(u \circlearrowleft \gamma) \phi(u \circlearrowright \gamma)]$$

$$S_R^\phi(u \circlearrowleft \gamma) = -R[\phi(u \circlearrowleft \gamma)]$$

finiteness a consequence of
properties of R .

$$\sum_{id} \phi \equiv \phi \circ S$$

$$\sum_{id} \phi * \phi(\tau) = 0.$$

R faithful along divergences

$\rightarrow \sum_{\Pi} \phi * \phi(\tau)$ free of divergences.

"principle of multiplicative subtraction"

• additive subtraction:

A has problem, B has same problem,

$A - B$ no problem.

• mult. subtr.: use group of characters

in general, add. subtr. special case.

Now, regulate, and subtract minimally.

$$\sum_{\Gamma} \phi(\Gamma) = \sum_{k=-\Gamma}^{-1} c_k z^k$$

$$\phi(\Gamma) = \sum_{k=-\Gamma}^{+\infty} b_k z^k$$

$$\sum_{\Gamma} \phi * \phi(\Gamma) = \sum_{k=0}^{\infty} d_k z^k$$

- some general properties in complex Lie groups
 - algebraic description of Diff
 - universality of underlying Hopf algebra of rooted trees
- understanding of the renormalization group, resolution of higher poles in residues

D

with \rightarrow complex regularization

$$\phi = \phi_-^{-1} \phi_+$$

$$\phi_+ = \phi_- \phi$$

$$= \int_{R=R_0}^* \text{Feynman Rules}$$

↑
minimal subst.

Birkhoff decomposition

\hookrightarrow solves Riemann-Hilbert problem

[\exists Diff. equation whose monodromy around $D=4$ is prescribed]

ϕ_- remains invariant under scale variations

$$\hookrightarrow g_{\text{eff}} = z_1 z_2^{-3/2} g$$

defines Hodge algebra homomorphism

Diff of physical parameters (\Rightarrow) Hodge alg. of Feynman graphs

$$z_1 = 1 + \langle \Delta \rangle + \dots$$

$$z_2 = 1 + \langle -\Delta \rangle + \dots$$

$$\Gamma \rightarrow e^{-t \text{quad}[\Gamma]} \quad \Gamma \equiv \Theta(r)$$

$[\phi = \Theta]^{-1} \phi$ is finite infinitesimal, pulled back $g_{\text{eff}} = \beta$

Only works for combination of z -factors

Let

$$Z_1 = 1 + \sum z_{1,2k} x^{2k}$$

$$Z_2 = 1 + \sum z_{2,2k} x^{2k}$$

$$g(x) = x Z_1 Z_2^{-3/2} \text{ regarded as a diffeom.}$$

$$Z_1 = 1 + x^2 \triangleleft + x^4 \left[\triangleleft + \triangleleft + \triangleleft + \frac{1}{2} (\triangleleft + \triangleleft + \triangleleft) + \frac{1}{2} \triangleleft \right] + \dots$$

$$Z_2 = 1 + \frac{1}{2} x^2 \circ + \frac{1}{2} x^4 [-\circ + \circ] + \dots$$

$$\log \left(\frac{\partial}{\partial x} x Z_1 Z_2^{-3/2} \right)$$

$$\delta_2^g = 3 z_{1,2} - \frac{9}{2} z_{2,2}$$

$$\delta_4^g = 5 \left[z_{1,4} - \frac{3}{2} z_{2,4} \right] - \frac{7}{2} z_{1,2}^2 + 6 z_{1,2} z_{2,2} - \frac{3}{4} z_{2,2}^2$$

$$\Delta_{\text{cr}} [\delta_4^g] = \delta_4^g \otimes 1 + 1 \otimes \delta_4^g + \frac{2}{3} \delta_2^g \otimes \delta_2^g$$

$$\begin{aligned} \Delta [\delta_4^g] &= \delta_4^g \otimes 1 + 1 \otimes \delta_4^g + 6 \triangleleft \otimes \triangleleft \\ &+ \frac{9}{2} \left[\triangleleft \otimes \circ + \circ \otimes \triangleleft \right] \\ &+ \frac{27}{2} \circ \otimes \circ \end{aligned}$$

Feynman graphs as insertion graphs

Γ provides places

$$\hookrightarrow \Gamma = \Gamma[\dots]$$

unique composition

associativities, equivariant actions of the permutation group \hookrightarrow graph.

$$\sum_{\text{places } i} \text{graph}_i \circ_i \omega = \text{graph}_1 + \text{graph}_2 + \text{graph}_3 + \text{graph}_4$$

$$=: \text{graph} * \omega \quad \omega * \text{graph} = \text{graph} + \text{graph}$$

Dyson-Schwinger Equations

& unique factorization

$$\textcircled{1} = \langle \rangle + g^2 \textcircled{1} + g^4 \textcircled{1} \quad (\text{linearized form})$$

$$\textcircled{1} = \langle \rangle + g^2 \textcircled{1} + g^4 [\textcircled{1} + \textcircled{1}] + g^6 [\textcircled{1} + \textcircled{1} + \textcircled{1}] + \dots$$

$$a \hat{=} \textcircled{1} \quad b \hat{=} \textcircled{1} \quad "p" \text{ prime graphs}$$

$$\begin{aligned} \rightarrow & 1 + g^2 a + g^4 [b + aa] + g^6 [ab + ba + aaa] \\ & + g^8 [aaaa + \underbrace{aab + aba + baa}_{aa \omega b \hat{=} \frac{1}{2} a \omega a \omega b}] + \dots \end{aligned}$$

$$\textcircled{1} = \prod_p \frac{1}{1 - p} \quad \leftarrow \text{Euler product}$$

the non-linear case

$$\textcircled{\bullet} = \triangleleft + g^2 \text{ (triangle with 3 nodes) } + g^4 \text{ (triangle with 6 nodes) }$$

$$\textcircled{\bullet} = \triangleleft + g^2 \triangleleft + g^4 [\text{triangle with 1 line} + \text{triangle with 2 lines} + \text{triangle with 3 lines} + \text{triangle with 4 lines}]$$

$$+ g^6 [\text{triangle with 5 lines} + \text{triangle with 6 lines} + \text{triangle with 7 lines} + \text{triangle with 8 lines} + \text{triangle with 9 lines} + \text{triangle with 10 lines} + \text{triangle with 11 lines} + \text{triangle with 12 lines} + \text{triangle with 13 lines} + \text{triangle with 14 lines} + \text{triangle with 15 lines}]$$

+ ...

a sequence of prime graphs $\underline{I} = \underbrace{(\gamma_1, \gamma_2, \dots)}_{\alpha \text{ elements}}$
compatible with Γ , $\underline{I} \sim \Gamma$

$$(\Rightarrow) \langle \Delta^{k-1}(\Gamma), \gamma_k \otimes \dots \otimes \gamma_1 \rangle = 1.$$

$$\sum_{\Gamma \sim \underline{I}} \frac{1}{n_{\Gamma}} \Gamma = \underline{\Gamma} \quad \underline{\Gamma}_1 \cdot \underline{\Gamma}_2 = \underline{\Gamma}(\underline{I}, \omega \underline{I}_2)$$

of seq comp. with Γ

← generalized shuffle product

$$\text{blob} = \prod_p \frac{1}{1-p}$$

$$\phi(\text{blob}) \stackrel{?}{=} \prod_p \frac{1}{1-\phi(p)}$$

(physicist's dream)

• it's time for leading coefficient of divergence

→ construct a "factorization scheme"!

→ steps involved: compensate all n -point subdivs by functions which have unique scaling (2-pt).

→ construction of automorphisms of \mathcal{H} determine the relevant anom. dim.

→ regulate by them

$$\frac{d \log z}{d \log r^2}$$

(=)

$$S * Y$$

↑ antipode of H

← grading operator of H

$$q^2 \Sigma(q^2) = \frac{a}{\pi^2} \int \frac{d^4 l}{l^2 (1 - Z(l^2))} \frac{q \cdot l}{(q+l)^2}$$

generated from $X = a B_+ \left(\frac{1}{1-x} \right)$

↳

$$\left. \frac{d \log (1 - \Sigma)}{d \log q^2} \right|_{\log q^2 = 0} = \gamma \left(a / (1 - \Sigma)^2 \right)$$

↙ anom. dim.

$$X \in \mathcal{H} = a B_+ \left(\frac{1}{1-x} \right) = a X_1 + a^2 X_2 + a^3 X_3 + \dots$$

↙ "beefaking" $\in \mathcal{H}$ $\in \mathcal{H}$ $\in \mathcal{H}$

$$F_{X_m}(X_k) = [2(k-m) - 1] X_{k-m}$$

$$\sigma_m^n = \lim_{\varepsilon \rightarrow 0} \varepsilon^n [\phi_0(S * Y^n)](X_m)$$

$\stackrel{\wedge}{=}$ coeff. of $(\log \frac{z^2}{r^2})^n$ in Σ

$$\sigma_m^n = \sum_{i=1}^{m-1} 2[(m-i) - 1] \sigma_i^1 \sigma_{m-i}^{n-1}$$

two factorizations!

Can we count?

$\mathbb{Q}(\sqrt{-5})$

$$6 \begin{array}{l} \swarrow \quad \searrow \\ 2 \cdot 3 = (1 + \sqrt{-5})(1 - \sqrt{-5}) \end{array}$$

this leads to considerations of ideals
in gauge theories, and more the to be
learned. [\rightarrow group theory, Galois theory...]

Any idea?

$$\zeta(7) = \sum \frac{1}{n^7}$$

$$\sim \zeta(5, 3)$$

as ϕ^7 in $\mathbb{Q}[D]$, this is an
invariant contribution to the β -function.

"a residue"

most non-planar graphs - most
interesting transcendental

[at 7 loops, even planar graphs
are "interesting", the non-planar ones
"fascinating"]

Conclusions

- Lie and Hopf algebra structures in perturbative expansions
- universal combinatorial structures
- identify a QFT by its number-content
- develop a representation theory
- how do "existent" QFTs fare?
- much to be learned soon
