

Perseverance and Other Challenges in Problem Solving

MELANIE SMITH

EYAL WALLENBERG

MATH FOR AMERICA

THE URBAN ASSEMBLY SCHOOL FOR LAW AND JUSTICE

Investigate . . .

If all the blood from everyone in the world was poured over Central Park, what depth would the blood reach?

- adapted from *Innumeracy* by John Allen Paulos

Turn and talk . . .

What are some pitfalls or challenges that a teacher may face when implementing complex tasks?

Challenges

- Students give up completely
- Students need constant reassurance that their answer is right or that their solution path is ok

Standards for Mathematical Practice

CCSS.Math.Practice.MP1 Make sense of problems and persevere in solving them.

Mathematically proficient students start by explaining to themselves the meaning of a problem and looking for entry points to its solution. They analyze givens, constraints, relationships, and goals. They make conjectures about the form and meaning of the solution and plan a solution pathway rather than simply jumping into a solution attempt. They consider analogous problems, and try special cases and simpler forms of the original problem in order to gain insight into its solution. They monitor and evaluate their progress and change course if necessary. Older students might, depending on the context of the problem, transform algebraic expressions or change the viewing window on their graphing calculator to get the information they need. Mathematically proficient students can explain their thinking to others, draw diagrams, write equations, use manipulatives, tables, and graphs or draw diagrams of important features and relationships, graph data, and search for regularity or trends. Younger students might rely on using concrete objects or pictures to help conceptualize and solve a problem. Mathematically proficient students check their answers to problems using a different method, and they continually ask themselves, "Does this make sense?" They can understand the approaches of others to solving complex problems and identify correspondences between different approaches.

Math Thinking

Everyone demands to understand
If you listen to the team, you hear people
explaining their thinking

The image shows a 'TEAMWORK RUBRIC' with three columns: 'Set Up', 'Cooperation', and 'Math Thinking'. The 'Math Thinking' column contains the text: 'Everyone demands to understand. If you listen to the team, you hear people explaining their thinking.' A red arrow points from this text to the main title 'Math Thinking' at the top of the slide. Another red arrow points from the 'Math Thinking' column to a handwritten note in a student's notebook that says 'Fix #4 before moving on. Also, I really love how well you work together but make sure all the work is shown on everyone's packet!'. The notebook also shows a date 'Monday, March 11' and a calculation for pi: $\pi(\pi) = 3.14159265359$. Other handwritten notes include 'LAUGHING' and 'everyone in team'.

Set Up:	Cooperation:	Math Thinking:
Students only talk to people in their team. All talk is about mathematical ideas.	Everyone's ideas are heard. Everyone helps.	Everyone demands to understand. If you listen to the team, you hear people explaining their thinking.

Fix #4 before moving on.
Also, I really love how well you work together but make sure all the work is shown on everyone's packet!

Monday, March 11

$\pi(\pi)$
3.14159265359

LAUGHING

everyone in team

Live “tweeting” of quotes and observations

Response Help	
Team 1	"Wait - how did you get that?" "Is everyone ready to go on? using multiple strategies
Team 2	great debate about what strategy to use

Team 3 "I dunno - Kimberley, what do you think?" **talk outside the group**
group is persisting, even though first strategy did not work.

Team 4 everyone helping "Can we make a table?"
"Does everyone understand what it's asking?"

Team 5 lovely tone - very supportive **talk on other topics**
"If that's the case, then could we use the other answer choices . . ."

Team 6 "I don't get what you said - can you explain again?"
"Why did you multiply there?"

Student-to-student feedback

Zyainah

What is one goal you have for your group?
get all our... comfortable with
sharing thinking.

**“... be comfortable with
sharing thinking.”**

Lynna Maxwell

1 What is one goal you have for your group

one goal for my group is I make sure
everyone understands.

**“... make sure everyone
understands.”**

What is one goal you have for your group?

A large rectangular area of white paper with horizontal blue lines, resembling a sheet of lined paper. A red horizontal line is drawn across the top of this area, just below the dashed line. The entire area is set against a light gray background.

Challenges

- Students give up completely
- Students need constant reassurance that their answer is right or that their solution path is ok

Standards for Mathematical Practice

CCSS.Math.Practice.MP3 Construct viable arguments and critique the reasoning of others.

Mathematically proficient students understand and use stated assumptions, definitions, and previously established results in constructing arguments. They make conjectures and build a logical progression of statements to explore the truth of their conjectures. They are able to analyze situations by breaking them into cases, and can recognize and use counterexamples. They justify their conclusions, communicate them to others, and respond to the arguments of others. They reason inductively about data, making plausible arguments that identify an argument's context from which the data arose. Mathematically proficient students are also able to compare the effectiveness of two plausible arguments, distinguish correct logic or reasoning from that which is flawed, and—if there is a flaw in an argument—explain what it is. Elementary students can construct arguments using concrete referents such as objects, drawings, diagrams, and actions. Such arguments can make sense and be correct, even though they are not generalized or made formal until later grades. Later, students learn to determine domains to which an argument applies. Students at all grades can listen or read the arguments of others, decide whether they make sense, and ask useful questions to clarify or improve the arguments.

Construct viable arguments and critique the reasoning of others.

NYS Geometry Regents, June 2012

16 In the diagram of $\triangle ABC$ shown below, $\overline{DE} \parallel \overline{BC}$.

If $AB = 10$, $AD = 8$, and $AE = 12$, what is the length of \overline{EC} ?

(1) 6

(3) 3

(2) 2

(4) 15

Alan's Answer: $\frac{18}{6} = \frac{15}{x}$

Noah's Answer:

$$\frac{24}{18} = \frac{15 + x}{15}$$

playing the skeptic

assessing hard to assess competencies

Knots and Ropes

Imagine that you and your friend each own a dog and you like to take them for walks together. You and your friend would like to shorten your dogs' leashes so that it is easier for you to pull the dogs apart when they tangle.

The leashes are different lengths and thicknesses.

Can you and your friend tie the same number of knots in each leash and end up with leashes that are the same length?

Jabari's work

I discovered that the **best way to solve this was to find a steady drop of the average** so I found the averages of both ropes.

Drop Rate	Thick& Long	Drop Rate	Thin & Short
3.5	55.5	3.5	35.5
5	52	4	32
5	47	3	25
4	38	4	22

After finding the drop rate of each number I **took all the drop rates added them up and then divided them ...**

Now that I found the average for both ropes **the next step was to choose a length to start from for both ropes** . . . I picked the numbers 80.1 and 74.5 as my starting points.

I steadily subtracted the average drop rate for the Thick& Long (4.3) and the average drop rate for the Thin & Short (3.5) until I got to an equal number of Knots and an equal length.

Novice-Expert Score	
<i>Problem Formulation</i>	
	Hypothesize
	<ul style="list-style-type: none"> • Hypothesis contains cause-and-effect or thesis statement • Hypothesis or thesis is sufficient to formulate a potential solution • Hypothesis or thesis makes sense and is complete
	Strategize
	<ul style="list-style-type: none"> • Strategy or strategies are appropriate to the subject area • Strategy or strategies will likely be effective for solving the problem
<i>Research</i>	
	Identify
	<ul style="list-style-type: none"> • Search method or methods are geared to the problem • Sources identified are related to the problem • Potential sources identified are sufficient to address the hypothesis or thesis
	Collect
	<ul style="list-style-type: none"> • Sources are collected systematically • Actual information collected is sufficient to address the hypothesis or thesis
<i>Interpretation</i>	
	Analyze
	<ul style="list-style-type: none"> • Analysis method or methods used are appropriate to the problem • Analysis method or methods are sufficiently systematic to reveal patterns in the data or information • Analysis generally helps support or call into question the hypothesis or thesis
	Evaluate
	<ul style="list-style-type: none"> • Findings selected are of value to completing the task • Findings are prioritized in a way that is useful to addressing the hypothesis or thesis • Findings are sufficient to help support or call into question the hypothesis or thesis
<i>Communication</i>	
	Organize
	<ul style="list-style-type: none"> • Final work product uses a logically consistent organizational structure • Final work product uses formats and conventions appropriate to the subject area
	Construct

	<ul style="list-style-type: none"> • Precision follows the subject area's rules and conventions • References are documented properly
	Confirm
	<ul style="list-style-type: none"> • Technical and grammatical accuracy is confirmed • Final product is consistent with the task's requirements and directions

Characteristics of Work Product					
Insight	Efficiency	Idea Generation	Concept Formation	Integration	Solution Seeking
Emerging Expert – 7					
Work product shows strong evidence of an intuitive sense of the use of subject-area rules to demonstrate insight	Work product treats task highly efficiently, few ways it could be done more efficiently	Work product shows strong evidence of novel or creative use of conventional ideas and/or strong evidence of unique or innovative ideas	Work product shows strong evidence of conscious design around a set of core concepts to organize and explain findings	Work product uses integration and connection among its elements in a highly effective fashion that is readily apparent	Work product shows strong evidence of a cogent, coherent solution strategy for the problem
Accomplished Strategic Thinker – 6					
Work product shows evidence of a more intuitive use of subject-area rules to gain insight beyond literal application of rules	Work product treats task efficiently, with a few minor or inconsequential inefficiencies	Work product shows strong evidence of novel or creative use of conventional ideas and/or clear evidence of original ideas	Work product is purposely and intentionally structured around a set of core concepts to organize and explain findings	Work product is integrated and connected in an effective fashion	Work product shows evidence of a cogent, coherent solution strategy for the problem
Strategic Thinker – 5					
Work product shows evidence of applying subject-area rules in an insightful fashion beyond literal application of rules	Work product is predominantly efficient in its treatment of the task, but some inefficiency may still be apparent	Work product shows strong evidence of proper use of conventional ideas and some evidence of original or novel ideas	Work product uses and incorporates a set of core concepts to organize and explain findings	Work product shows convincing evidence of integration or connection among all its elements	Work product shows evidence of a full and complete solution strategy for the problem
Emerging Strategic Thinker – 4					
Work product shows some evidence of applying subject-area rules in an insightful fashion beyond literal application of rules	Work product shows evidence of efficiencies in its treatment of the task, but has several areas where efficiency could be improved	Work product shows consistent evidence of proper use of conventional ideas and at least some evidence of original ideas or novel variations on	Work product uses and incorporates concepts to organize and explain findings but with some inconsistency	Work product shows evidence of integration or connection among all its elements with some places that are not well integrated or connected	Work product comes very close to a complete solution strategy
Accomplished Novice – 3					
Work product applies subject-area rules correctly and uses rules to demonstrate limited insight into subject area	Work product has areas of efficiency in its treatment of the task, but also contains significant inefficiencies	Work product shows consistent evidence of proper use of conventional ideas	Work product uses and incorporates concepts in a limited fashion to organize and explain findings	Work product shows limited evidence of integration or connection among all its elements and one or more places where lack of integration or connection is a problem	Work product falls short of a complete solution strategy
Novice – 2					
Work product applies subject-area rules in a procedural (literal) fashion	Work product is inefficient in its treatment of the task	Work product shows some evidence of proper use of conventional ideas	Work product organizes and explains findings in a way that does not use concepts in any significant fashion	Work product shows little evidence of integration or connection among all its elements and many places where lack of integration or connection is a problem	Work product falls well short of a complete solution strategy for the problem
Emerging Novice – 1					
Work product applies wrong rules, applies rules inefficiently, or not at all	Work product is highly inefficient, redundant, or confused in its treatment of the task	Work product shows little or no evidence of proper use of conventional ideas	Work product does not use or incorporate concepts and/or does not explain findings coherently	Work product shows essentially no evidence of integration or connection among all its elements	Work product fails to show a solution strategy for the problem

Accomplished Novice – 3

Work product shows consistent evidence of proper use of conventional ideas

Work product uses and incorporates concepts in a limited fashion to organize and explain findings

Novice – 2

Work product shows some evidence of proper use of conventional ideas

Work product organizes and explains findings in a way that does not use concepts in any significant fashion

Emerging Novice – 1

Work product shows little or no evidence of proper use of conventional ideas

Work product does not use or incorporate concepts and/or does not explain findings coherently

Modeling Standards

- **Making assumptions to simplify a situation**

CCSS.Math.Practice.MP4 Model with mathematics.

Mathematically proficient students can apply what they know to solve problems arising in everyday life, society, and the workplace. In early grades, this might be as simple as writing an addition equation to describe a situation. In middle grades, a student might apply proportional reasoning to plan a school event or analyze a problem in the community. By high school, a student might use geometry to model a situation or analyze a situation in terms of a quantity of interest that depends on another. Mathematically proficient students who can apply what they know are comfortable making assumptions and simplifying a situation, realizing that these may need revision later. They are able to identify important quantities in a practical situation and map their relationships using such tools as diagrams, two-way tables, graphs, flowcharts and formulas. They can analyze those relationships mathematically to draw conclusions. They routinely interpret their mathematical results in the context of the situation and reflect on whether the results make sense, possibly improving the model if it has not served its purpose.

- **Generalizing**

Questions that we are left with . . .

- Training and support for teachers?
- Making expectations clear to teachers and students?
- Standardizing the standards?
