Overview

Research described here is part of a large program to understand relationship between solvability of certain boundary value problems and smoothness assumptions on the coefficients of the operator: divergence-form, elliptic or parabolic, second or higher-order, systems.

The operators we focus on in this talk are (one possible) generalization of the Laplace operator in \mathbb{R}^n :

$$\triangle u = \sum_{j=1}^{n} \frac{\partial^2 u}{\partial x_j^2}$$

Note: $\triangle u = \operatorname{div} A \nabla$ where A = Id and we will be considering variable coefficient operators, where the matrix A shares certain structural properties such as positivity or ellipticity.

Jill Pipher Regularity of solutions to divergence form complex p-elliptic oper

Non-smooth Dirichlet data

The solution to Laplace's equation in \mathbb{R}^n_+ with data g(x) on the boundary t = 0 is given by an explicit formula: the Poisson extension $u(x,t) = \int_{\mathbb{R}^{n-1}} g(y) P_t(x-y) dy$. And this integral may converge even when g is only (Lebesgue) measurable g, not continuous: for example, if $g \in L^\infty$, then u is bounded and harmonic. And u converges weak-star to g.

Jill Pipher

Non-smooth Dirichlet data

The solution to Laplace's equation in \mathbb{R}^n_+ with data g(x) on the boundary t = 0 is given by an explicit formula: the Poisson extension $u(x,t) = \int_{\mathbb{R}^{n-1}} g(y) P_t(x-y) dy$. And this integral may converge even when \overline{g} is only (Lebesgue) measurable g, not continuous: for example, if $g \in L^{\infty}$, then u is bounded and harmonic. And u converges weak-star to g.

In fact, the Poisson integral of an L^p function for $1 \le p \le \infty$ makes sense, and satisfies the estimate:

$$\lim_{t\to 0}\int_{\mathbb{R}}|u(x,t)|^{p}dx=\int_{\mathbb{R}}|g(x)|^{p}dx$$

When 1 < p we have: u is the Poisson integral of an L^p function if and only if

Jill Pipher

Non-smooth Dirichlet data

The solution to Laplace's equation in \mathbb{R}^n_+ with data g(x) on the boundary t = 0 is given by an explicit formula: the Poisson extension $u(x,t) = \int_{\mathbb{R}^{n-1}} g(y) P_t(x-y) dy$. And this integral may converge even when g is only (Lebesgue) measurable g, not continuous: for example, if $g \in L^\infty$, then u is bounded and harmonic. And u converges weak-star to g.

In fact, the Poisson integral of an L^p function for $1 \le p \le \infty$ makes sense, and satisfies the estimate:

$$\lim_{t\to 0}\int_{\mathbb{R}}|u(x,t)|^{p}dx=\int_{\mathbb{R}}|g(x)|^{p}dx$$

When 1 < p we have: *u* is the Poisson integral of an L^p function *if* and only if

 $N(u)(x) \in L^p$ and u converges in L^p and pointwise almost everywhere *nontangentially* to its boundary data.

Jill Pipher Regularity of solutions to divergence form complex p-elliptic oper

Э

SQ C

Dirichlet problem on \mathbb{R}_+^{\ltimes}

$$u(x,t) = \int_{\mathbb{R}} g(y) P_t(x-y) dy,$$

 and

 $Nu(x) = \sup\{(u(x',t):(x',t)\in \Gamma(x,0)\}$

Nontangential maximal functions and the Dirichlet problem

With

$$Nu(x) = \sup\{(x',t) \in \Gamma(x,0) : u(x',t)\}$$

Jill Pipher Regularity of solutions to divergence form complex p-elliptic oper

Nontangential maximal functions and the Dirichlet problem

With

$$Nu(x) = \sup\{(x',t) \in \Gamma(x,0) : u(x',t)\}$$

The Dirichlet problem with data in L^p is uniquely solvable for Laplace's equation when p > 1 in smooth domains:

$$\Delta u = 0 \in \mathbb{R}^{n+1}_+, \ u(x,0) = f(x) \in L^p(\mathbb{R}^n)$$

with

$$\|Nu\|_{p} \leq C\|f\|_{p}$$

This apriori estimate for continuous $f \in L^p(\mathbb{R}^n)$ implies that solutions to the L^p Dirichlet problem converge nontangentially to their boundary values.

Jill Pipher

Regularity of solutions to divergence form complex p-elliptic oper

SQ C

Boundary value problems for second order divergence form operators

 $L := -\operatorname{div} A(X) \nabla$,, where $X = (x, t) \in \mathbb{R}^{n+1}$, or more generally above a Lipschitz graph.

Complex valued elliptic operators

Program: The study of solutions to operators of the form

$$L:=-\operatorname{div} A(x,t)
abla, \ \ (x,t)\in \mathbb{R}^n_+$$

where A may be complex valued, and the natural boundary value problems associated with them.

Some results in the complex setting takes place under the assumption that solutions to L satisfy DeG-N-M bounds. Other work focuses on structural assumptions on these operators. In [Dindos, P. 2016] we take the latter approach to develop a theory of regularity of solutions to complex coefficient operators and use this to solve certain boundary value problems.

The Kato square root problem

In 2001-2002: Auscher, Hofmann, Lacey, McIntosh, Tchamitchian collaborations led to the complete resolution of the Kato square root conjecture.

Let A by an $n \times n$ matrix of complex valued coefficients satisfying $\lambda |\zeta|^2 < Re(A\zeta, \zeta)$ and $(A\zeta, \zeta) < \Lambda |\zeta|^2$, for some real and positive λ and Λ .

Setting $L = -\operatorname{div} A \nabla$, the ellipticity condition enables one to define \sqrt{L}

The Kato square root problem (as re-formulated by McIntosh) asks about the domain of \sqrt{L} , namely whether one has the estimate $\|\sqrt{L}(f)\|_{L^2} \lesssim \|\nabla_{x} f\|_{L^2}$.

Theorem

Assume that the matrix A is p-elliptic. Then there exists $\lambda'_p = \lambda'_p(\lambda, \Lambda, \lambda_p) > 0$ such that for any nonnegative, bounded and measurable function χ and any u such that $|u|^{(p-2)/2}u \in W^{1,2}_{loc}(\Omega; \mathbb{C})$, we have

$$\Re e \int_{\Omega} \langle A(x) \nabla u, \nabla (|u|^{p-2}u) \rangle \chi(x) \, dx \ge \lambda_p' \int_{\Omega} |u|^{p-2} |\nabla u|^2 \chi(x) \, dx.$$
(3)

We also observe:

For all p > 1, and for all x for which $u(x) \neq 0$

$$|\nabla(|u(x)|^{p/2-1}u(x))|^2 \approx |u(x)|^{p-2}|\nabla u(x)|^2.$$

Let the matrix A be p-elliptic for $p \ge 2$ and let B have coefficients satisfying $|B_i(x)| \le K(\delta(x))^{-1}$, $\forall x \in \Omega$ Suppose that u is a $W^{1,2}_{loc}(\Omega; \mathbb{C})$ solution to \mathcal{L} in Ω . Then, for any ball $B_r(x)$ with $r < \delta(x)/4$,

$$\int_{B_r(x)} |\nabla u(y)|^2 |u(y)|^{p-2} dy \lesssim r^{-2} \int_{B_{2r}(x)} |u(y)|^p dy \qquad (12)$$

and

$$\left(\iint_{B_r(x))} |u(y)|^q dy\right)^{1/q} \lesssim \left(\iint_{B_{2r}(x)} |u(y)|^2 dy\right)^{1/2}$$
(13)

for all $q \in (2, \frac{np}{n-2}]$ when n > 2, and where the implied constants depend only p-ellipticity and K Jill Pipher When n = 2, a can be any Regularity of solutions to divergence form complex p-elliptic oper

Sketch of proof

Let $v = u\varphi$ where φ is a cut-off function function associated to the ball $B_r(x)$, and compute

$$\mathcal{L}\mathbf{v} = u\mathcal{L}\varphi + A\nabla u \cdot \nabla \varphi + A^* \nabla u \cdot \nabla \varphi.$$

Jill Pipher

Let $v = u\varphi$ where φ is a cut-off function function associated to the ball $B_r(x)$, and compute

$$\mathcal{L}\mathbf{v} = u\mathcal{L}\varphi + A\nabla u \cdot \nabla \varphi + A^*\nabla u \cdot \nabla \varphi.$$

Multiply both sides of this equation by $|v|^{p-2}\overline{v}$ and integrate by parts to obtain:

Jill Pipher

Regularity of solutions to divergence form complex p-elliptic oper

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶

æ

$$\int \nabla (|v|^{p-2}\overline{v}) \cdot A\nabla v \, dy = \int (|v|^{p-2}\overline{v})B \cdot \nabla v \, dy$$
$$+ \int \nabla (|v|^{p-2}\overline{v}u) \cdot A\nabla \varphi \, dy$$
$$- \int |v|^{p-2}\overline{v}u \, B \cdot \nabla \varphi \, dy$$
$$- \int |v|^{p-2}\overline{v}A\nabla u \cdot \nabla \varphi \, dy$$
$$- \int |v|^{p-2}\overline{v}A^*\nabla u \cdot \nabla \varphi \, dy$$

By *p*-ellipticity, the real part of the left hand side is bounded from below by $\lambda_p \int |v|^{p-2} |\nabla v|^2 dy$.

Jill Pipher

Regularity of solutions to divergence form complex p-elliptic oper

Each term is treated separately. For example, the first of the five terms on the right hand side above has the bound

$$\left|\int (|v|^{p-2}\overline{v}) \cdot B\nabla v \, dy\right| \lesssim Kr^{-1} \left(\int |v|^{p-2} |\nabla v|^2 \, dy\right)^{1/2} \left(\int |v|^p \, dy\right)^{1/2}$$

which yields

$$\int_{B_{r}(x)} |\nabla u(y)|^{2} |u(y)|^{p-2} dy \lesssim r^{-2} \int_{B_{2r}(x))} |u(y)|^{p} dy$$

æ

Assumptions on the coefficients, explained

Some observations on the structural assumptions made for solvability of the Dirichlet problem. It suffices to formulate the result in the case $\Omega = \mathbb{R}^n_+$ by using the pull-back map alluded to above. Because the coefficients are required to have *small* Carleson norm this puts a restriction on the size of the Lipschitz constant of the map that defines the domain Ω .

For technical reasons we also required that all coefficients A_{0j} , j = 0, 1, ..., n-1 are real. This can be ensured as follows. When j > 0:

 $\partial_0([\Im m A_{0j}]\partial_i u) = \partial_j([\Im m A_{0j}]\partial_0 u) + (\partial_0[\Im m A_{0j}])\partial_i u - ([\partial_i \Im m A_{0j}])\partial_0 u$

which allows one to move the imaginary part of the coefficient A_{0j} onto the coefficient A_{j0} at the expense of two first order terms. However, this does not work for the coefficient A_{00}

Jill Pipher Regularity of solutions to divergence form complex p-elliptic oper

SQ CA

We will require that A_{00} is real, then a multiplication of the coefficients of $\mathcal{L} = \partial_i (A_{ij}(x)\partial_j) + B_i(x)\partial_i$ by $\alpha = A_{00}^{-1}$ reduces one to $A_{00} = 1$. When α is real (or when $\Im m \alpha$ is sufficiently small) *p*-ellipticity of *A* is equivalent to *p*-ellipticity of the new operator.

if $\Im m \alpha$ is not small, the *p*-ellipticity, after multiplication of A by α may not be preserved. Thus, in the most case, one must assume the *p*-ellipticity of the new matrix \tilde{A} which has all coefficients \tilde{A}_{0j} , $j = 0, 1, \ldots, n-1$ real.

Jill Pipher

Regularity of solutions to divergence form complex p-elliptic oper

<日 → < □ > < □ > < □ >

The proof proceeds by establishing, through an integration by parts and stopping time argument, the equivalence of the *p*-adapted square function and the *p*-averaged nontangential maximal function. The connection to *p*-ellipticity is made in the following estimate:

$$\begin{split} \lambda'_{p} \iint_{\mathbb{R}^{n}_{+}} |\nabla u|^{2} |u|^{p-2} x_{0} \, dx' \, dx_{0} &\leq \int_{\mathbb{R}^{n-1}} |u(0,x')|^{p} \, dx' \\ &+ C \|\mu'\|_{\mathcal{C}} \int_{\mathbb{R}^{n-1}} \left[\tilde{N}_{p,a}(u) \right]^{p} \, dx'. \end{split}$$
