

## NOTETAKER CHECKLIST FORM

(Complete one for each talk.)

Name: Rebekah Palmer Email/Phone: palmer@temple.edu (443) 621-7023

Speaker's Name: Sarah Witherspoon

Talk Title: From groups to Hopf algebras: Cohomology and varieties for modules

Date: 02 / Feb / 18 Time: 11 : 00 (am) / pm (circle one)

List 6-12 key words for the talk: representation theory, groups, homology, cohomology, Hopf algebras, support varieties, quantum groups, projective modules

Please summarize the lecture in 5 or fewer sentences: To a group action on a vector space, one associates a geometric object called its support variety that is defined using group cohomology. Hopf algebras generalize groups and include many important classes of algebras such as Lie algebras and quantum groups. The theory of varieties for modules generalizes to Hopf algebras to some extent. We define Hopf algebras, their cohomology, and the corresponding varieties for modules.

## CHECK LIST

(This is **NOT** optional, we will **not pay** for **incomplete** forms)

- Introduce yourself to the speaker prior to the talk. Tell them that you will be the note taker, and that you will need to make copies of their notes and materials, if any.
- Obtain ALL presentation materials from speaker. This can be done before the talk is to begin or after the talk; please make arrangements with the speaker as to when you can do this. You may scan and send materials as a .pdf to yourself using the scanner on the 3<sup>rd</sup> floor.
  - **Computer Presentations:** Obtain a copy of their presentation
  - **Overhead:** Obtain a copy or use the originals and scan them
  - **Blackboard:** Take blackboard notes in black or blue **PEN**. We will **NOT** accept notes in pencil or in colored ink other than black or blue.
  - **Handouts:** Obtain copies of and scan all handouts
- For each talk, all materials must be saved in a single .pdf and named according to the naming convention on the "Materials Received" check list. To do this, compile all materials for a specific talk into one stack with this completed sheet on top and insert face up into the tray on the top of the scanner. Proceed to scan and email the file to yourself. Do this for the materials from each talk.
- When you have emailed all files to yourself, please save and re-name each file according to the naming convention listed below the talk title on the "Materials Received" check list.  
(YYYY.MM.DD.TIME.SpeakerLastName)
- Email the re-named files to [notes@msri.org](mailto:notes@msri.org) with the workshop name and your name in the subject line.

From Groups to Hopf Algebras: Cohomology and Varieties for Modules

mention about co-ops  
 in algebra that structure  
 of Hopf algebras (co-ops)

Thank organizers. <sup>a MSRI facility up to the level of hospitality</sup> great to see so many students and postdocs here.

Motivating Question For a given group or ring, (what are all its reps?)  
 Can we understand all its representations in some meaningful way?  
 (i.e. actions on vector spaces)

I will talk about one method to organize such info that started with finite groups where there is a very rich theory - passing through group cohomology - that Jon Carlson spoke about this morning. I will talk about generalizations to an important class of rings known as Hopf algebras, because one big application of group representation theory is to other settings that involve groups in some way or to which analogous techniques may be applied.

Hopf Algebras

or other ring

$k = \bar{k}$

Defn A Hopf algebra is an algebra  $A$  (over a field  $k$ ) together with maps  
 $\Delta: A \rightarrow A \otimes A$ ,  $\varepsilon: A \rightarrow k$ ,  $S: A \rightarrow A$  satisfying some properties (that will be given)  
 ( $\otimes$  is  $\otimes_k$ )

Examples (1)  $A = kG$ , group algebra,  $\Delta(g) = g \otimes g$ ,  
 $\varepsilon(g) = 1$ ,  $S(g) = g^{-1}$   $\forall g \in G$

(2)  $A = U(\mathfrak{g})$ , univ. env. alg. of Lie alg  $\mathfrak{g}$ ,  $\Delta(x) = x \otimes 1 + 1 \otimes x$ ,  
 $\varepsilon(x) = 0$ ,  $S(x) = -x$   $\forall x \in \mathfrak{g}$   
 e.g.  $U(\mathfrak{sl}_2) = k\langle e, f, h \mid fe = ef - h, he = eh + 2e, hf = fh - 2f \rangle$

(3)  $A = U_q(\mathfrak{g})$ , quantum group ( $q \in k$ )

(4)  $A = u_q(\mathfrak{g})$ , small quantum group ( $q^n = 1$ )  
 e.g.  $u_q(\mathfrak{sl}_2) = \mathbb{C}\langle e, f, k \mid e^n = 0, f^n = 0, k^n = 1, k e k^{-1} = q^2 e, k f k^{-1} = q^{-2} f, e f - f e = \frac{k - k^{-1}}{q - q^{-1}} \rangle$

$\Delta(e) = e \otimes 1 + k \otimes e$ ,  $\Delta(f) = f \otimes k^{-1} + 1 \otimes f$ ,  $\Delta(k) = k \otimes k$

Fact  $A$ -modules may be "added" (direct sum) and "multiplied" (tensor product). (get a "tensor category" or ring)

(Hopf algs arose first in topology, also in rep. th., math. phys., combinatorics, quantum computing...)

have an idea of understanding co-ops

generalizing from the case of a finite group

From now on:  $A$  is a (fin. dim.) Hopf algebra,  $k$  is an  $A$ -mod via  $\varepsilon$   
 ("trivial"  $A$ -mod)

Hopf algebra cohomology

Notation:  $H^*(A, k) := \text{Ext}_A^*(k, k) := \bigoplus_{n \geq 0} \text{Ext}_A^n(k, k)$

where one defn of  $\text{Ext}_A^n(k, k)$  is as equivalence classes of " $n$ -extensions" of  $A$ -modules:

$$k \rightarrow M_n \rightarrow M_{n-1} \rightarrow \dots \rightarrow M_1 \rightarrow k$$

Remarks (1)  $H^*(A, k)$  has a sum (Baer sum) and product (Yoneda splice)

(2)  $H^*(A, k)$  is graded commutative

(3) For an  $A$ -mod  $M$ , define  $H^*(M) := \text{Ext}_A^*(M, M)$  similarly.

Then  $H^*(M)$  is an  $H^*(A, k)$ -module via " $- \otimes M$ " (explain) (coloured double-dot to about  $n$ -ext)

Example  $A = kG$   $H^*(A)$  is group cohomology  $H^*(G, k)$  as in Jon Carlson's talk

etingof-ostrik '04 but earlier had thought of it before that

Conjecture  $H^*(A, k)$  is finitely generated.

(equiv. Noetherian under some conditions or isomorph. in char 0)

Known to be true for:

- (1)  $A = kG$  ((Golod '59, Venkov '59, Evens '61))
- (2) (more generally)  $A$  cocommutative (explain Friedlander-Parkhill '83 Friedlander-Suslin '77)
- (3)  $A = U_q(\mathfrak{g})$ , small quantum group (Ginzburg-Kumar '93, Bondel-Nakano-Parkhill-Villen '14)
- (4) (more generally)  $A$  "pointed" under some conditions (Nistorak-Petrova-Schauenburg-W '11)
- (5) some others (and much current research on various types by many groups of mathematicians)  
25. Friedlander-Suslin, Nguyen-Wang-Lai

Caution: A related conjecture for Hochschild cohomology is false!

(Problem is we don't (yet) know enough about fin. dim. Hopf algs to get a general result)

copy this with address

 25. Friedlander-Suslin  
 25. Friedlander-Suslin

Varieties for Modules

Big Picture:

From now on: Assume  $A$  is such that  $H^*(A)$  is fin. gen. and  $H^*(M)$  is fin. gen.  $H^*(A)$ -mod (for all fin. dim.  $M$ )

Defn (support variety) <sup>in mod</sup>

$V_A(k) := \text{max ideals of } H^*(A, k)$  (max ideals under Zariski topology)

$V_A(M) := \text{max ideals containing annihilator } J \text{ of } \text{Ext}_A^*(M, M)$

use  
Zariski  
topology

In all settings in earlier list, varieties for modules have been studied to a greater or lesser extent:

- (1) Quillen '71, Avramin-Scott '82, Carlson '83, ...
- (2) Suslin-Friedlander-Bendel '97, Friedlander-Peterson '05, '07, ...
- (3) Parshall-Wang '93, Ohtake '98, Liu-Kingdon-Morita (was Balmer spectrum (subset) to avoid, think Zariski topology)
- (4) not much known - some beginnings: (e.g. some work of mine w/ Peterson & W/Peterson)

Some applications of varieties for modules are to determining representation type  
 to determining structure of module category (e.g. classifying indecomposable modules)

Useful in these applications are -

Properties

(1)  $V_A(M) = \{0\}$  iff  $M$  is projective  
 (more generally:  $\dim(V(M)) = \text{complexity of } M$   
 (rate of growth of minimal proj. res.))

(2)  $V_A(M \oplus N) = V_A(M) \cup V_A(N)$  (also for tensor)

(3) ~~(restriction)~~ for every closed  $V \subseteq V(k)$ , there is an  $A$ -mod  $M$  s.t.  $V(M) = V$  (Feldvoss-W '10)

(4)  $V_A(M \otimes N) \subseteq V_A(M) \cap V_A(N)$  (by standard arguments: e.g. Feldvoss-W '10)

and equality holds under some restrictions -

of  
Zariski  
topology

What  
is  
the  
complexity  
of  
M?

on  $A$  :  $V_A(M \otimes N) = V_A(M) \wedge V_A(N)$  if  $A$  is cocommutative (Friedlander-Perisova's) or a quantum element. gr. (Purdon-W'09)

on  $N$  :  $V_A(M \otimes N) = V_A(M) \wedge V_A(N)$  if  $N$  is a "Carson  $L_S$ -module" (PW '09, FW '10)

Open question ~~Does~~  $V_A(M \otimes N) = V_A(M) \wedge V_A(N)$ ? whenever  $A$  is almost cocommutative?   
 "tensor product property" (\*)   
 (explain, e.g. gr. ~~can know counterexample~~)

(or at least can we answer this question when  $A = u_q(\mathfrak{g})$ ?)

(\*) does not always hold! -

finite dimensional? have it on job structure

Thm (Beason-W) <sup>but are still working under that assumption</sup> let  $A$  be a f.d. ~~non-cocommutative~~ Hopf algebra such that  $H^*(A)$  is fin. gen and  $H^*(M)$  is fin. gen as  $H^*(A)$ -mod for all fin dim  $A$ -mods  $M$ . If  $A$  satisfies ~~the tensor product property~~ then  $A$  is a subalgebra of a Hopf algebra that does not satisfy (\*).   
 (explain idea - wreath-type coproduct so that ty. of mods behaves like a semidirect or wreath product of groups)

if you (Ch. Beason) had some more info on the mod. but not appear

Open Ques. Does (\*) hold for a: "quasitriangular" Hopf algebras?

Related open questions (maybe can be answered without support varieties?)

Fix  $A$ .  
 (1)  $M \otimes N$  projective iff  $N \otimes M$  projective?   
 ( $\forall M, N$ )

(implied by t.p. property =  $V(M \otimes N) = V(M) \cup V(N) = V(N \otimes M)$  is 0 iff  $M \otimes N$  is proj. &  $N \otimes M$ )

(2)  $M$  projective iff  $M^{\otimes n}$  projective?   
 ( $\forall M$ )

(implied by t.p. property, similarly)

(if time)

Examples (Benson-W)

Let  $L$  be a finite group acting on  $G$  by automorphisms, notation  $lg$  ( $l \in L, g \in G$ )

$k^L := \text{Hom}_k(L, k)$ , an algebra under pointwise multiplication

$A := kG \rtimes k^L$  semidirect coproduct (dual to semidirect product  $k^G \rtimes L$ )  
(a Hopf algebra)

tensor product of modules is not commutative up to iso ( $\text{mod-}A \cong (\text{mod-}kG) \rtimes L$ )

and  $V(M \otimes N) \neq V(M) \cap V(N)$  in general

(see next page for details if there is more time)

References

"Varieties for modules of finite dimensional Hopf algebras" (W.)

[www.math.toronto.edu/~rsjw/pub/SuprVarSurvey-revised.pdf](http://www.math.toronto.edu/~rsjw/pub/SuprVarSurvey-revised.pdf)

Example: non commutative tensor products (joint work with Dave Benson)

Let  $L$  be a finite group acting on  $G$  by automorphisms, notation  ${}^x g$  ( $x \in L, g \in G$ )

$k^L := \text{Hom}_k(L, k)$ , an algebra under pointwise multiplication,

basis  $\{p_e \mid e \in L\}$  dual to  $L$ , so  $p_h p_e = \delta_{h,e} p_e \quad \forall h, e \in L$

$A := kG \otimes k^L$  as an algebra (tensor product multiplication)

$A$  is a Hopf algebra with "semidirect comultiplication" i.e.  $\Delta: A \rightarrow A \otimes A$  given by

$$\Delta(g \otimes p_e) := \sum_{\substack{x, y \in L \\ xy = e}} (g \otimes p_x) \otimes ({}^x g \otimes p_y)$$

$$\text{and } \varepsilon(g \otimes p_e) = \delta_{1,e}, \quad S(g \otimes p_e) = (g^{-1}) \otimes p_{e^{-1}}$$

(Rk:  $A$  is dual, as a Hopf alg, to the skew gp alg  $k^G \rtimes L$  with tensor product coalg-etc.)

$A$ -modules: The  $p_e$  are central idempotents so if  $M$  is an  $A$ -mod then

$$M \cong \bigoplus_{e \in L} \left( M_e \otimes k p_e \right)$$

(some  $kG$ -mod      1-dim  $k^L$ -mod)

Tensor products: If  $M, N$  are  $A$ -mods then

$$(M \otimes N)_e \cong \bigoplus_{\substack{x, y \in L \\ xy = e}} M_x \otimes ({}^x N_y)$$

where  $({}^x N_y)$  is the  $kG$ -mod  $N_y$  but with action  $g \cdot v = ({}^x g) v \quad \forall v \in N_y, g \in G$

That is, the tensor category of  $A$ -modules has a semidirect product str.  
 $\text{mod-}A \cong "kG\text{-mod} \rtimes L"$

There are  $L, G, M, N$  for which  $V(M \otimes N) \neq V(M) \cap V(N)$   
 (in fact neither containment holds!)

(Be prepared to discuss more details, e.g. exactly what is  $V(\cdot)$ ,  
 choice of  $L, G, M, N$ , etc., from other talk notes.)
