Random Graphs

• Models for networks (electrical, social, biological)

Spectral gap in regular graphs

- 32

Random Graphs

- Models for networks (electrical, social, biological)
- Sparsity (stat. phys.: percolation, real-world networks) and expansion characteristics (fast mixing)

Random Graphs

- Models for networks (electrical, social, biological)
- Sparsity (stat. phys.: percolation, real-world networks) and expansion characteristics (fast mixing)
- Data science / Machine Learning (matrix completion, coding, community detection, recommender systems, pattern recognition, bioinformatics)

• A *hypergraph* has (single) *hyperedges*, $e \subset V$.

• A *hypergraph* has (single) *hyperedges*, $e \subset V$.

- 3

• A *hypergraph* has (single) *hyperedges*, $e \subset V$.

Examples include co-authorship, social networks, protein interactions.

Ioana Dumitriu (UCSD)

Spectral gap in regular graphs

September 24, 2021 5 / 30

- 3

• A *hypergraph* has (single) *hyperedges*, *e* ⊂ *V* (generally *k* ≥ 2). It can be

- A *hypergraph* has (single) *hyperedges*, *e* ⊂ *V* (generally *k* ≥ 2). It can be
 - *uniform*: $\exists k$ such that all hyperedges $e \in V^k$ (unordered, no loops); k = 2 recovers graphs.

- A *hypergraph* has (single) *hyperedges*, $e \subset V$ (generally $k \ge 2$). It can be
 - *uniform*: $\exists k$ such that all hyperedges $e \in V^k$ (unordered, no loops); k = 2 recovers graphs.
 - *regular*: each vertex in *v* belongs to the same number *d* of hyperedges. Notation: (*d*, *k*)–uniform hypergraph.

- A *hypergraph* has (single) *hyperedges*, $e \subset V$ (generally $k \ge 2$). It can be
 - *uniform*: $\exists k$ such that all hyperedges $e \in V^k$ (unordered, no loops); k = 2 recovers graphs.
 - *regular*: each vertex in *v* belongs to the same number *d* of hyperedges. Notation: (*d*, *k*)–uniform hypergraph.

• Any hypergraph has a natural *adjacency matrix;* any uniform hypegraph has a natural *adjacency tensor*. More later.

- In particular, the spectra of random graphs/hypergraphs is connected to *expansion*, and as such can (also) be used in the study of satisfiability, recommender systems, pattern recognition, matrix completion, etc. AND recently, neural networks.
- Best way to understand expanders is via the *spectral gap*.

Spectra of (Random, Regular) Graphs

• Adjacency matrix of a graph: $A = (a_{ij})$, $a_{ij} = \delta_{i \sim j}$, for all vertices *i*, *j*. Symmetric if graph is undirected.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Spectra of (Random, Regular) Graphs

- Adjacency matrix of a graph: A = (a_{ij}), a_{ij} = δ_{i~j}, for all vertices i, j.
 Symmetric if graph is undirected.
- If edges are not independent (regular, bipartite biregular) entries are *weakly dependent*. Interesting, slightly harder, but more rigid and other benefits (connectivity).

Spectra of (Random, Regular) Graphs

- Adjacency matrix of a graph: A = (a_{ij}), a_{ij} = δ_{i~j}, for all vertices i, j.
 Symmetric if graph is undirected.
- If edges are not independent (regular, bipartite biregular) entries are *weakly dependent*. Interesting, slightly harder, but more rigid and other benefits (connectivity).
- For both regular and biregular bipartite, global shape of spectra well-understood since the '80s and '90s (Kesten-McKay, Godsil-Mohar); outliers are more recent.

Shape of the spectra

• For *d*-regular graphs with *d* finite, largest eigenvalue is *d* with all-ones eigenvector

Shape of the spectra

- For *d*-regular graphs with *d* finite, largest eigenvalue is *d* with all-ones eigenvector
- As $n \to \infty$, the asymptotic spectrum shape is given by Kesten-McKay distribution with density supported on $[-2\sqrt{d-1}, 2\sqrt{d-1}]$:

$$f_d(x) = rac{d\sqrt{4(d-1)-x^2}}{2\pi(d^2-x^2)}$$

10/30

Shape of the spectra

- For *d*-regular graphs with *d* finite, largest eigenvalue is *d* with all-ones eigenvector
- As $n \to \infty$, the asymptotic spectrum shape is given by Kesten-McKay distribution with density supported on $[-2\sqrt{d-1}, 2\sqrt{d-1}]$:

$$f_d(x) = \frac{d\sqrt{4(d-1) - x^2}}{2\pi(d^2 - x^2)}$$

• As $d \to \infty$, f_d converges to the semicircle density (Wigner).

NB matrix, classical and modern

- Ideas have been around for a while, see e.g. Angel, Friedman, Hoory ('07).
- Sometimes a self-avoiding matrix has been used (close notion).
- Since '15, not only used for regular graphs but also for non-homogeneous Erdős-Rényi (Benaych-Georges, Bordenave, Knowles, '17, Alt, Ducatez, Knowles '19, '21), directed graphs (Coste '17), etc.
